DETERMINATION OF THE AERODYNAMIC INTERFERENCE
BETWEEN THE SPACE SHUTTLE ORBITER, EXTERNAL TANK,
AND SOLID ROCKET BOOSTER ON A 0.004 SCALE ASCENT CONFIGURATION

By P. Ramsey, R. Buchholz, E. Allen, and J. Dehart

ABSTRACT

The launch configuration of the space shuttle has the orbiter and two solid rocket boosters joined to the external tank. This report presents results of wind tunnel tests on a 0.004 scale model launch (ascent) configuration with multi-internal balance arrangements which allowed determination of aerodynamic interference characteristics between individual components.

Four basic configurations were utilized during the test. They were: (1) modified North American ATP Space Shuttle Launch Vehicle with an ogive nose on the external tank (separate balances used on the orbiter and external tank); (2) configuration (1) without retro-rockets (single sting balance located in the external tank); (3) North American ATP Orbiter alone; and (4) 0.005128 scale model of one solid rocket booster.

Six component aerodynamic force and moment data were recorded over an angle of attack range of -10 to 10 degrees at 0 degree sideslip. A sideslip range of -10 to 10 degrees at 0 degree angle of attack was also tested. Mach number range for the test was varied from 0.6 to 4.96 with Reynolds number varying between 4.9×10^6 and 6.8×10^6 per foot.

MODEL DESCRIPTION AND TUNNEL INSTALLATION

Figures 2 through 4 represent the geometry of the ascent configuration composed of orbiter, SRB, and external tank configurations. Other pertinent dimensional information for each model component is given in Table IV. The external tank, SRB bodies, and nose cones are made of aluminum while the SRB nozzles are made of brass. All other parts are constructed of stainless steel.

In order to determine interference loads between individual launch components several model-tunnel mounting methods were necessary and are delineated in Table I. A description of the mounting methods is given below.

(MULTI STING SYSTEM)

Utilizing the MSFC Parallel Staging Mounting System (see Figure 5), the orbiter was mounted on the upper sting of the system while the external tank was mounted on the lower sting. The SRB's were mounted either on the external tank (termed metric configuration) or on individual stings (termed non-metric configuration). Figures 10 and 11 show these mounting arrangements with Figure 10 depicting the left SRB in the metric position and Figure 11 showing the right SRB in the non-metric position.

(LAUNCH CONFIGURATION SINGLE STING)

The launch configuration was tested on a single sting mounted to the tunnel sector with the balance located in the external tank. The launch configuration dimensions and general layout are shown in Figure 2.

(ORBITER ALONE)

The orbiter alone was tested on the upper sting of the MSFC Parallel Staging Mounting System. The orbiter configuration is shown in Figure 3.

(SRB ALONE)

The SRB alone was tested on a single sting mounted to the tunnel sector (see Figure 12). The SRB configuration general layout is depicted in Figure 4.

CONFIGURATIONS INVESTIGATED

Test results reported herein were obtained on the following model configurations (see Table 1).

1. A 0.004-scale modified NR ATP Launch Configuration mounted on the MSFC Parallel Staging Mounting System with the orbiter and external tank on separate stings and balances; additional stings (not instrumented) were utilized when the SRB's were not attached (non-metric) to the external tank. Data were recorded by the separate balances for the following configurations:

ORBITER BALANCE

<u>Configuration</u>	<u>Description</u>
(01)/(T3)	Orbiter in presence of External Tank.
(01)/(T3) (S1)	Orbiter in presence of External Tank with both SRB's attached.
(01)/(T3)/(S1)	Orbiter in presence of External Tank with both SRB's present but not attached to External Tank.

(01)/(T3)(S 1/2)/(S 1/2) Orbiter in presence of external tank
with one SRB attached and one present
but not attached to the external tank.

EXTERNAL TANK BALANCE

<u>Configuration</u>	<u>Description</u>
(T3)/(01)	External tank in presence of orbiter.
(T3)(S1)/(01)	External tank and both SRB's attached in presence of orbiter.
(T3)/(S1)/(01)	External tank in presence of unattached SRB's and orbiter.
(T3)(S 1/2)/(S 1/2)/(01)	External tank with one SRB attached in presence of the second SRB and orbiter.
(T3)(S 1/2)/(S 1/2)	External tank with one SRB attached in presence of second SRB.
(T3)/(S 1/2)	External tank in presence of one SRB.

2. The following 0.004-scale configurations were mounted on a single sting-balance instrumentation arrangement:

(01)	Orbiter configuration
(01)(T5)(S1)	Launch configuration
(T3)	External tank
(T3)(S1)	External tank with both SRB's attached.

3. A single 0.005128-scale ATP solid rocket booster (S 1/2) was also mounted on a single sting-balance instrumentation arrangement.

Specific dimensions for the configurations, described below, can be found in the dimensional data (Table IV):

<u>SYMBOL</u>	<u>DESCRIPTION</u>
O ₁	NR ATP baseline orbiter less ASRM (abort solid rocket motors); (B1C1D1F1M1) (W1E1) (V1K1R1)
T ₃	318-inch diameter external tank with ogive nose cone and retro-rocket package.
T ₅	318-inch diameter external tank with ogive nose cone. Retro-rocket package removed and replaced with 26.5-inch radius nose.
S ₁	Two 156-inch diameter SRBs (solid-rocket boosters) with 17° nose cone and hold down arms (ATP baseline) (0.004 scale).
S 1/2	One 156-inch diameter SRB (solid-rocket booster) with 17°30' nose cone with hold down arms (ATP configuration (N1B1E1) (0.005128 scale).

The following names are used to define orbiter control deflection for this investigation:

CONTROL SURFACES						NOMENCLATURE			
RUDDER FLARE	RUDDER	ELEVONS				ELEVTR δ_e	AILRON δ_a	RUDDER δ_r	RUDDER FLARE, δ_{RF}

AILRON δ_a Inboard and outboard elevons deflected together for roll control
 ELEVTR δ_e Inboard and outboard elevons deflected together for pitch control
 RUDDER δ_r Normal rudder control
 RUDFLR δ_{RF} Rudder flare

TEST FACILITY DESCRIPTION

The Marshall Space Flight Center 14" x 14" Trisonic Wind Tunnel is an intermittent blowdown tunnel which operates by high pressure air flowing from storage to either vacuum or atmospheric conditions. A Mach number range from .2 to 5.85 is covered by utilizing two interchangeable test sections. The transonic section permits testing at Mach 0.20 through 2.50, and the supersonic section permits testing at Mach 2.74 through 5.85. Mach numbers between .2 and .9 are obtained by using a controllable diffuser. The range from .95 to 1.3 is achieved through the use of plenum suction and perforated walls. Mach numbers of 1.44, 1.93 and 2.50 are produced by interchangeable sets of fixed contour nozzle blocks. Above Mach 2.50 a set of fixed contour nozzle blocks are tilted and translated automatically to produce any desired Mach number in .25 increments.

Air is supplied to a 6000 cubic foot storage tank at approximately -40°F dew point and 500 psi. The compressor is a three-stage reciprocating unit driven by a 1500 hp motor.

The tunnel flow is established and controlled with a servo actuated gate valve. The controlled air flows through the valve diffuser into the stilling chamber and heat exchanger where the air temperature can be controlled from ambient to approximately 180°F. The air then passes through the test section which contains the nozzle blocks and test region.

Downstream of the test section is a hydraulically controlled pitch sector that provides a total angle of attack range of 20° ($\pm 10^\circ$). Sting offsets are available for obtaining various maximum angles of attack up to 90°.

TEST PROCEDURE

(MULTI STING DATA)

In order to obtain data with nominal separation distances and incidence angles, two different orbiter to tank separation distances and three orbiter to tank incidence angles were tested. The separation distances were .12 and .24 inches. The incidence angles tested were -1.2, 0, and 1.5 degrees. For beta sweeps, a separation distance of .12 inches and an orbiter incidence angle of 0 degree was used.

The orbiter and tank were electrically isolated from the stings by use of insulative tape and non-conducting balance keys. These bodies were wired to a fouling circuit to detect fouling for any combination of orbiter, tank or SRB tested. No control deflections were used for this portion of the test.

(LAUNCH CONFIGURATION SINGLE STING DATA)

The orbiter and SRB's were attached to the external tank which was mounted to balance #232 and a straight sting mounted to the tunnel sector system. No control deflections were used for this portion of test.

(ORBITER ALONE DATA)

The orbiter was mounted on MSFC balance #231 on the upper sting of the MSFC Parallel Staging Mounting System. The lower sting of this system was removed for this series of runs. To obtain the sideslip series at -5 degrees angle of attack, the orbiter was preset to -5 degrees angle of attack with the relative pitch control assembly (see Figure 5) and then the entire system was rotated 90 degrees so that the tunnel sector could

be utilized to obtain sideslip angle. Elevon surfaces were deflected to obtain control effectiveness data.

(SRB ALONE DATA)

The SRB model was mounted on MSFC balance #231 and a straight sting mounted to tunnel sector. The test was conducted with the model in the zero roll position only (same position as if they were mounted on external tank).

DATA REDUCTION

All model forces and moments are resolved in the body axis system and are presented in the form of non-dimensional coefficients. This investigation had two model sizes, therefore, all reference dimensions are given in full scale values as well as in model values. See individual dimensional sheets for detail model dimensions (Table IV).

All moments were referenced about model station 4.820 on the external tank (ET) which is equivalent to orbiter fuselage station 0.0 (see Figures 2 and 8).

Reference dimensions for the configurations are:

*0.005128 scale model

Base axial force coefficients were calculated using the following equations:

MULTI STING LAUNCH

$$\text{Orbiter:} \quad CAB = - CPB_O \frac{Ab_O}{S_{ref}}$$

$$\text{Tank \& SRB:} \quad CAB = - CPB_E \frac{Ab_E}{S_{ref}} - CPB_S \frac{Ab_S}{S_{ref}}$$

Where:

$$CPB_O = (Pb_O - P_\infty)/q$$

$$CPB_S = (Pb_S - P_\infty)/q$$

$$CPB_E = (Pb_E(\text{avg}) - P_\infty)/q$$

SINGLE STING LAUNCH CONFIGURATION

$$\text{Orbiter:} \quad CAB_O = - CPB_O \frac{Ab_O}{S_{ref}}$$

$$\text{Tank:} \quad CAB_E = - CPB_E \frac{Ab_E}{S_{ref}}$$

$$\text{SRB:} \quad CAB_S = - CPB_S \frac{Ab_S}{S_{ref}}$$

Where:

$$CPB_O = (Pb_O - P_\infty)/q$$

$$CPB_E = (Pb_E(\text{avg}) - P_\infty)/q$$

$$CPB_S = (Pb_S - P_\infty)/q$$

Therefore:

$$CAB = CAB_O + CAB_E + CAB_S$$

ORBITER ALONE:

$$CAB = - CPB_O \frac{Ab_O}{S_{ref}}$$

Where:

$$CPB_O = (Pb_O - P_\infty)/q$$

SRB ALONE:

$$CAB_1 = - CPB_1 \frac{Ab_{s1}}{S_{ref}}$$

$$CAB_2 = - CPB_2 \frac{AB_{s2}}{S_{ref}}$$

Where:

$$CPB_1 = (P_1 - P_\infty)/q$$

$$CPB_2 = (P_2 - P_\infty)/q$$

and:

$$Ab_{s1} = 1/2 \text{ of base area } (\frac{0.503}{2} \text{ in}^2)$$

$$Ab_{s2} = 1/2 \text{ of base area } (\frac{0.503}{2} \text{ in}^2)$$

Therefore:

$$CAB = CAB_1 + CAB_2$$
